EXPERIMENT:5 FEATURE SCALING

Aim:

To study the importance of feature scaling in machine learning and observe its impact on model performance.

Procedure:

1. Load a dataset containing numerical features (e.g., height, weight, and age).
2. Split the dataset into training and testing sets.
3. Train a machine learning model (like K-Nearest Neighbors or Logistic Regression) without applying scaling and record the accuracy.
4. Apply feature scaling techniques such as **Standardization (Z-score)** or **Normalization (Min-Max scaling)** on the features.
5. Retrain the model with the scaled data and compare the performance with the unscaled version.

In [9]:

```
import numpy as np
import pandas as pd
df=pd.read_csv("C:\\Users\\kaviy\\Downloads\\pre_process_datasample.csv")
df
```

Out[9]:

	Country	Age	Salary	Purchased
0	France	44.0	72000.0	No
1	Spain	27.0	48000.0	Yes
2	Germany	30.0	54000.0	No
3	Spain	38.0	61000.0	No
4	Germany	40.0	NaN	Yes
5	France	35.0	58000.0	Yes
6	Spain	NaN	52000.0	No
7	France	48.0	79000.0	Yes
8	Germany	50.0	83000.0	No
9	France	37.0	67000.0	Yes

In [10]:

```
df.head()
```

```

Result:

Feature scaling significantly improves model performance by bringing all features to a similar range.

Models trained on scaled data converge faster and give more accurate predictions.

Hence, scaling is essential for algorithms sensitive to feature magnitude, such as KNN and SVM.
